Electric Power Statistics

Statistics on electric power have long been regarded as valuable indicators of a country's economic activity, and in recent months the anticipated shortage of power in the Central Canada industrial area has greatly quickened the interest in them. They cannot show the extent of the shortage, for the "demand" for power is something which no meter can measure—it exists solely in the intentions of the industrial, commercial and individual consumers—but there is much information in the published statistics of electric power which can throw light on the situation. The interpretation of the statistics, however, will be made easier by an examination of the structure of the industry in Canada and a definition of some of the technical terms used—after having first surveyed the reports that the Dominion Bureau of Statistics issues on this industry.

Reports on Electric Power

The Bureau has been collecting figures on electric power since 1917. As part of the Census of Industry—which annually obtains and publishes statistics on the structure of each industry—a report is published each year entitled *Census of Industry: Central Electric Stations in Canada*. It contains information on electric power plants, revenue, expenses, employees, number of customers, pole line mileage, auxiliary plant equipment, main plant equipment, electric energy generated, and fuel.

Current figures on the production and consumption of electric power—the production broken down by type of power and the consumption broken down by provinces—are given in a monthly publication entitled *Central Electric Stations*. Other annual reports on the industry are *Use of Electric Power in Manufacturing and Mining Industries* and *Index Numbers of Cost of Electricity for Domestic Service and Tables of Domestic Bills*. A resume of the information given in the annual and monthly reports on central electric stations will be found in Table 19 of the *Canadian Statistical Review*, pages 47 and 48, and useful information on the industry appears in each issue of *The Canada Year Book*.

Central Electric Stations

The core of the electric power industry in Canada is the central electric stations. These

can be defined as companies, municipalities or individuals selling or distributing electric energy whether generated by themselves or purchased for resale. The stations are generally divided into two classes (i) privately owned and operated, and (ii) owned and operated by provincial or municipal commissions, and these in turn are sub-divided according to the type of power produced or distributed (a) hydraulic, (b) fuel, (c) non-generating. The only type of station excluded from the central electric category, therefore, is the plant producing power exclusively for the use of its own company, and these represent considerably less than 10 p.c. of the total output. Furthermore, the relative importance of the central station is steadily increasing.

Hydro-Electric Power: Primary and Secondary Power

The importance of water power in the generation of electricity in Canada is shown by the fact that of the total output of central electric stations in 1946 (and 1947) 97.6 p.c. was hydro-electric and 2.4 p.c. was produced by "thermal" (i.e. fuel generated) plants, which compared with 69.4 p.c. produced by thermal plants in the United States in 1946. Canada is fortunate in her large resources of water power, which derive from the fact that the great fresh water areas of the country are mainly situated at considerable heights above sea level.

The relative costs of hydro and thermal electric power depend on a variety of factors, such as the economical availability of coal or the proximity of the water resources. Canada is therefore additionally fortunate that the greater proportion of her large water power resources is in what is termed the "acute fuel zones" of Ontario and Quebec, where native coal is not economically situated but which in other respects are well suited to industrial development.

An important feature of Canada's hydro-electric production is the practice of selling power under two classifications, "primary" and "secondary". Primary power is sold to the customer on a contract basis and is delivered as and when he demands it. Secondary power is sold to the customer on the basis

that it will be delivered when and as it is available; the delivery can be interrupted by the station, though in practice the dispatcher tries to keep his customers informed as to when secondary power will or will not be available. Because of the interruptible nature of its delivery, secondary power is sold at a considerably lower rate than primary power. It is of use in industries such as pulp and paper, which operate on low pressure steam which can be stored in the boilers during temporary interruptions of the power supply and replenished when power is again available.

Secondary power is a characteristic of water power resources, and its availability is due to the fact that the demand for primary power does not run at a constant level throughout the whole day. If secondary power can be sold during the periods of slack demand for primary power, water is employed which otherwise would remain idle or run waste. Secondary power is particularly important in what are known as "uncontrolled streams"—rivers like the Niagara and the St. Lawrence where there is no storage dam behind which water not required at the moment can be stored—but it is also of some importance in "controlled streams"—where such storage facilities do exist—when water is not short and is available at "off-peak" periods.

Measuring Plant Capacity and Output

The capacity of a power plant or the estimated potential capacity of water falls is measured in terms of horsepower, whereas the output of power from the plant is measured in kilowatt hours. Technically, a "horsepower" is the amount of power required to lift one pound 550 feet in one second. A "watt" is used for measuring electric power; it is the rate of working of electricity in a circuit when the electromotive force is one volt and the intensity of the current one ampere, but it may mean more to the layman to say that 746 watts equal one horsepower. A kilowatt is a thousand watts, and a kilowatt hour is the amount of power obtained from a plant producing one kilowatt continuously for one hour.

Figures of Production and Consumption

Trends in the production of electric power since 1920 and in the uses to which it has been put—i.e. for primary or secondary consumption or for export—are shown in the chart on page iv. Somewhat more detailed figures on pro-

duction, showing the division between hydro-electric and thermal, and figures for consumption are shown in the first part of Table 19 (page 47). (It is sometimes forgotten by the non-engineer that the total production of power must equal the total consumption—i. e. including exports and line losses—because no electric current is produced unless some person turns on a switch in their house, shop, factory or elsewhere in order to light a light, start an engine or a heater, or some similar thing).

The second part of Table 19 (page 48) shows the consumption of electric power by provinces. All of the power consumed in a province is not necessarily produced there, and the monthly report *Central Electric Stations* shows the amount of power delivered from each province to other Canadian provinces and the amount received from other provinces. Quebec, Manitoba and British Columbia are on balance exporters of power to other provinces (Quebec, particularly, being an important supplier of Ontario) and Ontario, New Brunswick and Alberta are on balance importers. Incidentally, before leaving the consideration of provincial consumption, it is interesting to note how the use of power in Saskatchewan and Alberta has risen very spectacularly in recent years, due largely to increased industrialization.

Information on power consumed by various industries is only available on an annual basis. The latest published figures are for 1945, and they show that the pulp and paper industry took 22.6 p.c. of the total output of central electric stations plus imports, metal smelting and refining took 16.9 p.c., and ferro-alloys, abrasives, electro-chemicals and steel furnaces took a total of 8.1 p.c. This group of industries together took 47.6 p.c. of the total, and all other industries took 23.9 p.c., making 71.5 p.c. for all industry. Residential service took 8.4 p.c., commercial lighting 4.0 p.c., street lighting .6 p.c. and free service .2 p.c. Exports to the United States amounted to 6.6 p.c. and losses to 8.7 p.c.

The Present Power Shortage

The current shortage of power in Central Canada is a combination of two factors, greatly increased use of power (see the chart) and a low rainfall this year. Because of this situation power stations which draw their water from controlled streams are limiting their output, for otherwise they might face February and March with little or no water left in their

reservoirs. A symptom of the shortage is the decline in the quantity of secondary power available, resulting from the rising demand for primary power. This same development took place in 1941 to mid-1943, when the demand for power was again straining the capacity. With a slackening of overall demand the available supply of secondary power increased, and rose sharply in 1945 and 1946, but again declined in 1947 and fell further in the first eight months of 1948. As a result of this, certain normal purchasers of secondary power have had to revert to using their own fuel boilers. Some limited production of secondary power is not, of course, inconsistent with an acute shortage because, as explained above, the demand for primary power is not constant and during the period when it falls below capacity the water would be wasted, in the case of uncontrolled streams, if it were not used to produce secondary power.

This shortage has naturally had an effect on construction plans. The situation in regard to new hydro-electric installations is reviewed in the following extract from a report issued on March 15, 1948, by the Dominion Water and Power Bureau of the Department of Mines and Resources:

"During 1947, additions to the generating capacity of the country totalled 178,800 h.p. which is slightly more than half the normal rate of increase. Due to large additions made during the war years, material and labour shortages, and to anticipated drop in power consumption in the early post-war period, little construction was undertaken during 1945 and 1946. However, power demand continued to grow vigorously during 1946 and 1947, largely due to a high level of industrial activity; shortages of power, particularly in southern Ontario, required

the imposition of restrictions on power use late in 1947. The great demand for electricity has caused marked activity by power-producing agencies and has resulted in a huge program of hydro-electric construction, there being at present under construction plants which will have a capacity of over 1,000,000 h.p. of which probably 500,000 h.p. will come into operation during 1948."

To give further points of comparison, the total of water power installations in Canada amounted to 10,491,000 h.p. at the end of 1947, and the largest increase in any one year was in 1943, when the total rose by 989,000 h.p. Further hydro construction plans have, of course, been completed since the report quoted above was issued, and also some construction of steam generating plants is planned—in particular, one at Windsor with an initial capacity of 160,000 h.p. and an ultimate capacity of double that amount.

Exports

Exports of power from Canada to the United States have shown some decline in 1947 and during 1948. In the first eight months of 1948 about 77 p.c. of these exports consisted of primary power on firm contracts and about 23 p.c. of secondary power. The whole of the export of power from Quebec to the United States was primary power, from Ontario it was about two-thirds primary and one-third secondary, and from British Columbia and New Brunswick it was almost entirely primary power. Most of the export of secondary power from Ontario comes from the Queenston plant, which is one of the largest "uncontrolled stream" plants. Electricity is exported from Canada only by licence granted by the Electricity and Gas Inspection Services of the Department of Trade and Commerce.

POWER PRODUCED BY CENTRAL ELECTRIC STATIONS IN CANADA

* The first eight months in 1948 shown as an annual rate.

Current Economic Conditions

There has been little change in the prevailing high level of activity during the summer months as production, employment and income data continue to show gains over last year. The declining level of agricultural prices in the United States, in particular the drop in the prices of wheat, corn and cotton, is being watched with interest; recent trends in Canada have been somewhat less conclusive. The index of prices received by farmers for agricultural products, based on 1935-39=100, advanced during August from 250.4 to a new high of 256.0, reflecting higher prices for livestock, dairy products, poultry and eggs. The cost-of-living index also rose 1.4 points in August to 158.9 as prices in all the budget groups moved upward.

Two recent announcements by the federal government underline the improvement in Canada's foreign exchange position. The \$300 million loan negotiated last fall with the Export-Import Bank of Washington has been terminated; the \$140 million that was drawn from March to June has been repaid out of the proceeds of the \$150 million bond issue sold by the Canadian Government in the United States this summer. Also, the import restrictions on fresh fruits and vegetables and the import quotas on citrus fruits and juices are to be relaxed from November 1.

The adverse trade balance with the United States showed a further decline in August, amounting to \$20.3 million as compared with \$28.6 million the previous month and \$71.6 million in August, 1947. For the eight months ending in August, the trade deficit with the United States totalled \$277.1 million—more than 57 per cent lower than the deficit of \$644.5 million in the same period last year. With the United Kingdom, the favorable balance to the end of August has been reduced from \$372.1 million a year ago to \$276 million, but the overall favorable balance with all countries has shown an increase of over 62 per cent—from \$121.6 million in 1947 to \$197.2 million this year.

National Accounts Since 1926

The recent publication for the first time by the Bureau of balancing tables on Canada's income and expenditure since 1926 constitutes

an important addition to available data on recent Canadian economic developments.⁽¹⁾ Using the information now provided in the national accounts, greater perspective is possible in analyzing the widespread economic repercussions of the two major events in the last twenty-two years—the depression and the second world war—and their aftermaths. (The fluctuations of the gross national product and its main components during this period are shown in the chart on page vi). Previously published totals of the national accounts covered only the years since 1938, and these have now been revised in the light of the latest available source materials.

Production was at its prewar peak levels in 1928 and 1929, with a gross national product of \$5,985 million and \$5,956 million, and national income was also highest in 1928 at \$4,750 million. Both declined sharply by 1933—the gross national product was reduced over 42 per cent and the national income almost 50 per cent. Gradual recovery after 1933 (excepting the slight recession in 1938) raised the gross national product to 94 per cent and national income to 90 per cent of their 1928 totals in 1939.

Increased utilization of Canada's resources to meet the enormous demands of war resulted in a spectacular expansion of output and income; in 1944 production was 112 per cent above its 1939 value and national income had increased more than 126 per cent. Industrial reconversion led to a small decline in production in 1945, but the increasing trend was resumed in the following two years—in 1947 output stood almost 139 per cent higher than in 1939 and the increase in national income was even larger, 156 per cent.

These figures on national output of course reflect price changes as well as changes in physical volume, since the gross national product is measured at market prices. Thus it is evident that the physical reduction of output during the depression was not as large as indicated in the figures—from 1929 to 1933 the cost-of-living index dropped over 22 per cent. Conversely, higher prices are included in the great increase in the gross national product since

⁽¹⁾ *National Accounts, Income and Expenditure, 1926-1947.*

the outbreak of war, but an increase in physical volume of about 100 per cent is nevertheless indicated since 1939; on the other hand the real increase in 1947 was comparatively small due to the rapid rise in prices. It is interesting to note that from 1926 to 1947 the gross national product on a per capita basis (using the intercensal population estimates) increased from \$549 to \$1,063, almost 94 per cent; in the same period, the cost-of-living index moved from 121.8 to 135.5—an increase of about 11 per cent.

Changes in Distribution of National Income

Examination of the national income since 1926 reveals the changing proportions accruing to the main earning groups. The proportion taken by the largest component, labour income (including military pay), is clearly highest in periods of depression—it rose to over 75 per cent in 1933, compared with an average of about 56 per cent in 1926-28, and since the end of the war (during which it was close to 60 per cent) it has again moved to approximately 57 per cent. On the other hand, the percentage of national income earned by investment was sharply reduced from about 17 per cent in 1929 to less than 8 per cent in 1932, then recovered to 18 per cent in 1939 and increased since the end of the war to 21 per cent in 1947.

The trend in the proportion of total income taken by agriculture is similar, although an underlying decline in the relative importance of agricultural production due to increasing industrialization seems to be evident. Thus the share of the national income earned in farming operations declined from a high of 17 per cent in 1926 to 4 per cent in 1933, then increased to a high of 13 per cent in 1942 and has since remained close to 11 per cent. A similar trend has taken place in the United States, where the share of national income earned in agriculture appears to have been stabilized at about 7 per cent in recent years.

The proportion of national income earned in unincorporated business other than agriculture has shown a greater stability since 1926 than that of the other groups. It has ranged generally from about 9 per cent in 1928 to a high of over 11 per cent in 1947; it reached a low of 7 per cent in 1932 and during the war stood between 8 per cent and 9 per cent.

Retail Trade Trends

This year's substantial increase in employment, the expansion of money incomes in all sectors of the economy, the greatly improved supply situation in most consumer goods, and the growing volume of sales on credit are among the factors contributing to the continued high level of consumer spending. On the other hand, the steady rise in prices since the beginning of the year and the resultant pressure on "real" incomes have undoubtedly led to some contraction in the purchasing power of certain groups and have also been reflected in a measure of sales resistance on the part of the buying public generally. Monthly data on retail trade give some indication of present trends.

Indexes of retail trade, based on the dollar sales reported by a sample of stores in 14 kinds of business, with no adjustments for price changes or seasonal variations, show a general sales increase of 12 per cent in the first eight months of 1948 over the corresponding period a year ago. But since retail commodity prices show a larger increase in the current period—about 21 per cent—some reduction in the physical volume of goods moving through retail outlets is apparent so far this year.

Although all the different types of retail stores surveyed by the Bureau show some increase in dollar volume up to the end of August over a year ago, there is considerable diversity in their sales records. The sales increases range from a high of over 17 per cent for women's clothing stores to a low of less than 3 per cent for furniture stores, with stores in both the food and clothing groups showing generally larger increases than those in the household and personal effects group. Among the general merchandisers, variety stores show the largest increase, 15 per cent, followed by department stores with 14 per cent and country general stores with 8 per cent.

Lower Production of Milk and Cheese

A decline in farm milk production has been evident since the beginning of the year, due mainly to inadequate supplies of feed during the winter and early spring, followed by the late spring and slow pasture growth in many parts of the Prairie Provinces. Other important factors contributing to the reduction both in the milk cow population and the percentage of cows being milked are the con-

★ CANADA'S INCOME AND PRODUCTION SINCE 1926

★ For a description of the various items in the National Accounts see June and July issues of the Canadian Statistical Review.

tinued short supply and increasing price of farm labour, and the highly favourable conditions in other types of agricultural production. In August, the latest month for which figures are available, total milk production of 1,771 million pounds was 2 per cent lower than in August, 1947, and during the first eight months of the year output was more than 3 per cent lower. At the same time fluid sales of milk and cream have also been reduced—to the end of July, they were 92 million pounds lower, nearly 4 per cent less than in 1947.

The decline in cheese production is particularly marked; to the end of September, with the period of peak production over, this year's output has dropped to 76 million pounds compared with 104 million pounds a year ago, a decline of over 26 per cent, and in the month of September alone, production was nearly a third lower. Exports of cheese in the first eight months declined from 13.7 million pounds in 1947 to less than 8 million pounds this year.

Imports to Meet Seasonal Shortage of Butter

The production of creamery butter, despite a good recovery during the summer months, has been about 7 million pounds or 3 per cent lower in the first nine months of the year compared with the same period in 1947. Cold storage holdings, which were about 6 million pounds lower than a year ago at the beginning of the heavy production season on May 1, have not been raised to their normal level during the summer due to the continued rise in domestic disappearance. At October 1, stocks amounted to 53.4 million pounds, almost 20 million pounds less than at the same time last year; the 1943-47 average of storage holdings at October 1 was over 72 million pounds.

In order to meet minimum domestic requirements during the winter months of low production, the Canadian Government has arranged for the importation of 15 million pounds of butter from October to the end of January. The imports will be from Denmark, Australia and New Zealand, with Denmark shipping

some 11 million pounds. The imported butter will be retailed at the ceiling prices established in the various parts of Canada, and will be distributed to the wholesale trade through the Canadian Commercial Corporation under the direction of the Wartime Prices and Trade Board.

Higher Output of Concentrated Milk Products

In the first nine months of the year total production of concentrated milk products was over 15 per cent higher than in 1947. In all, nearly 9 per cent of all milk used in factory dairy production now goes into the manufacture of concentrated milk products, with evaporated milk as the most important item in the group, taking over 6 per cent. During the January-September period, the production of evaporated milk rose from 174 million pounds in 1947 to 203 million pounds this year, an increase of more than 16 per cent. Condensed milk production during the same period was almost 22 per cent higher and whole milk powder was up over 22 per cent. The production of ice cream has also continued to increase—production in the first nine months totalled over 21 million gallons, an increase of nearly 10 per cent over last year.

Although milk production has declined as noted previously, the upward trend in estimated cash farm income from the sale of dairy products has been maintained due to the higher prices obtained for milk sold off farms this year—which averaged \$2.84 per hundred pounds in August as against \$2.28 a year earlier. During the first half of 1948, the estimated cash farm income from the sale of dairy products has been estimated at \$180 million, compared with \$143 million in 1947 and \$133 million in 1946 for the corresponding period. The outlook for dairy production has been adversely affected in recent weeks by the unusually heavy drought in many areas, particularly in Ontario—resulting in severe damage to pastures and a reduction in the amount of after-growth on meadows and harvest fields available for forage.

*Averages of five weeks.

Preliminary.

⁽¹⁾Monthly averages or calendar months. Series revised in March number, shifting to clean instead of greasy weight.⁽²⁾Annual data as of middle of July. Monthly data for dates varying from 8th to 17th of month. February 1947 as of 22nd.⁽³⁾Average quarterly statistics are given in the monthly section.⁽⁴⁾Interim index of retail prices, June 17, 1947 = 100.⁽⁵⁾Series revised, June 30, 1947 = 100.

⁽¹⁾Excluding producers' interchange.⁽²⁾Prior to 1946, exports include pigs, ingots, blooms, billets and rolling mill products.⁽³⁾Prior to 1946, imports include castings and forgings and rolling mill products. Since 1946, they include, in addition to all other shapes, wire and wire rope. A substantial part of the imports appears after refinishing in total shipments. Production of primary iron and steel shapes from Canadian steel is equivalent to about 72 percent of the total production of ingots.

⁽¹⁾Hollow blocks including fireproofing and load-bearing tile.⁽²⁾Planks and boards.⁽³⁾Prior to 1946 figures represent gross value of production. Figures for 1946 and 1947 are factory sales of firms which normally account for 96% of total Canadian production.

Production and Acreage of Principal Field Crops

⁽¹⁾Includes imports except for 1948-49.⁽²⁾Figures of customs exports for 1945-46 and 1946-47 are adjusted to reflect actual physical movements from Canada. Previous to 1945-46 adjusted figures are not available. The statistics for 1947-48 are customs exports and will be adjusted when required information is available.⁽³⁾Prior to 1936-37 Canadian customs figures are used. From 1936-37 to date, exports consist of overseas clearances plus U.S. imports for consumption.⁽⁴⁾Includes customs exports of Canadian oatmeal and rolled oats.⁽⁵⁾Preliminary.

⁽¹⁾ Available for January, April and August only.⁽²⁾ Includes advance equalization payment on barley until March 1947, and subsidy on hogs from 1944 to date.⁽³⁾ Based on price for hogs including Dominion premium. A rise in ratio favours production of beef.⁽⁴⁾ Prior to August 1939, Barley No. 1 feed was designated as Barley No. 3 C.W.⁽⁵⁾ Subject to revision.

⁽¹⁾ Beginning in 1946, customs exports are adjusted to reflect actual physical movement of wheat flour from Canada.

Data shown for the last four months are not so adjusted.

⁽¹⁾ Australia, New Zealand, South Africa, India and Pakistan.⁽²⁾ Includes Belgium, China, Czechoslovakia, France, Netherlands, Netherlands Indies and Norway.

Source: Monthly Report; Imports for Consumption, Trade of Canada, D.B.S.

*Statistics cover transactions reported by investment firms, stock exchanges and other security dealers in Canada. Not included are: new issues of Canadian securities floated abroad, redemptions of called or matured Canadian bonds owned abroad, and some transactions by other than the reporting agencies. Complete statistics regarding capital movements are included in the annual reports on the "Canadian Balance of International Payments".

⁽¹⁾ Annual results are from the Canadian Balance of International Payments and monthly totals as given in Trade of Canada. In the balance of payment figures trade statistics have been adjusted to bring them closer to the international exchange of goods with each country, by using payments data or other substitutes in the case of certain special groups of transactions where physical movements of goods do not reflect international financial transactions, —e.g.—special shipments of munitions during the war, and the warehousing of Canadian wheat outside of Canada. Mutual aid exports are represented by financial transactions which in some years are subject to revision. Non-commercial items have been deducted throughout.

*See footnote of page 102.
